

Bring a discussion forum to your site with Hyvor

There are many paid and free [third-party widgets](#) that can be embedded into your site.

Another free alternative to [Disqus](#) is [Hyvor](#).

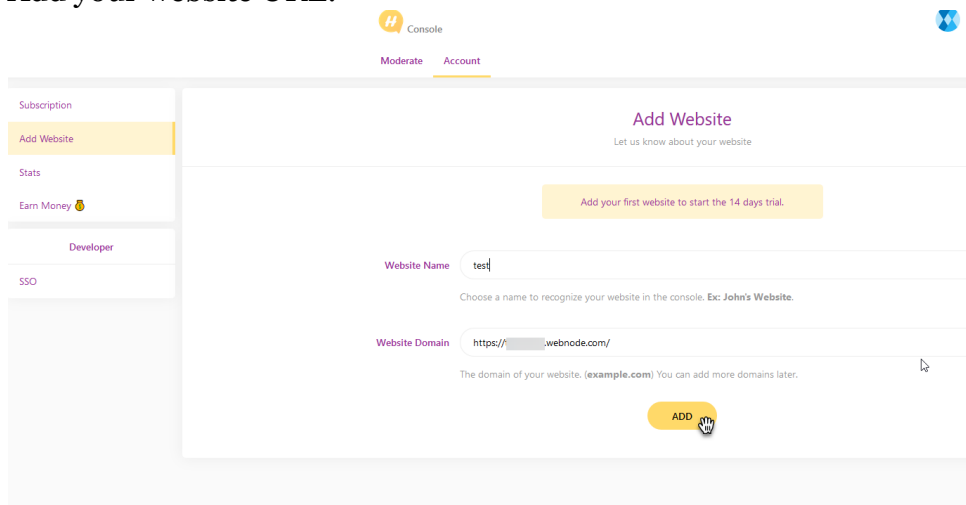

This is a step-by-step quick guide to implement a discussion chat on your site with Hyvor.

1. Go to the Hyvor site and register at: <https://talk.hyor.com>

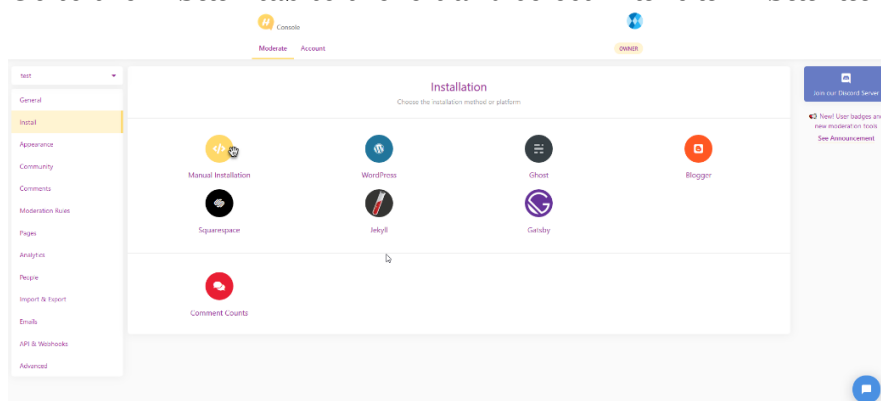

The image shows the 'LOG INTO HYVOR' login form. It has two input fields: 'Email' with a placeholder ending in '.com' and 'Password' with masked characters. Below the password field is a security warning: 'This connection is not secure. Logins entered here could be compromised. Learn More'. There is a 'Remember Me' checkbox and a 'LOG IN' button. At the bottom, it says 'Need to create new account? Sign Up!'

2. Add your website URL:

The image shows the 'Add Website' form in the Hyvor dashboard. The left sidebar has tabs for Subscription, Add Website (selected), Stats, Earn Money, Developer, and SSO. The main area has a title 'Add Website' and a subtitle 'Let us know about your website'. A yellow banner says 'Add your first website to start the 14 days trial.' Below are two input fields: 'Website Name' with the value 'test' and 'Website Domain' with the value 'https://.webnode.com/'. A note says 'Choose a name to recognize your website in the console. Ex: John's Website.' and another says 'The domain of your website, (example.com) You can add more domains later.' There is an 'ADD' button at the bottom right.

3. Go to the **install** tab to the left and select **manual installation**:

The image shows the 'Installation' screen in the Hyvor dashboard. The left sidebar has tabs for General, Install (selected), Appearance, Community, Comments, Moderation Rules, Pages, Analytics, Profile, Import & Export, Email, API & Webhooks, and Advanced. The main area has a title 'Installation' and a subtitle 'Choose the installation method or platform'. There are eight icons representing different installation methods: Manual Installation, WordPress, Ghost, Blogger, Squarespace, Jekyll, Gatsby, and Comment Counts. A 'OWNED' badge is visible in the top right corner.

4. Copy the entire code displayed in the field under point 1:

Manual Installation

Install Hyvor Talk manually on your website

[Select Other Platform](#)

1

Add the following code into the webpage you need Hyvor Talk be loaded.

```
<div id="hyvor-talk-view"></div>
<script type="text/javascript">
  var HYVOR_TALK_WEBSITE = 3795; // DO NOT CHANGE THIS
  var HYVOR_TALK_CONFIG = {
    url: false,
    id: false
  };
</script>
<script async type="text/javascript" src="//talk.hyvor.com/web-api/embed"></script>
```

COPY

2

If your webpage **does not have** `rel="canonical"` tags, we recommend you to add the URL and an unique ID manually. To do that,

- Replace the first `false` (after `url`) with the URL of your page. Ex: `url: "https://example.com/mywebpage"`.
- Replace the second `false` (after `id`) with a unique ID of the page. Ex: `id: "1125"`. In most cases, database ID of your post can be used as the unique ID.

If you keep the URL and ID `false` (make sure you have canonical tags in your webpage), the both URL and ID will be the canonical URL of your webpage.

Good to know: The unique ID is used to identify each webpage uniquely by Hyvor Talk. This ID can be used to load the same comments on different pages and to load comment counts on your homepage.

5. Paste the code where on the page where you like the forum to appear and publish the changes:
